

8th ANNUAL REPORT

of the

Ornithological Society of New Zealand

RINGING COMMITTEE

For the Year Ending 31st March, 1958

Compiled by F. C. Kinsky, Ringing Convener

INTRODUCTION

This report deals with all birds ringed and recovered between 1st April, 1957, and 31st March, 1958, as far as they were reported to the Convener. It also contains a small number of birds ringed and recovered before 1st April, 1957, and not mentioned in previous reports. No distinction is made.

The Ringing Committee advises that an offer was made by the Department of Internal Affairs to supply all the rings required for the use of the Ornithological Society's Ringing Scheme. This offer was most gratefully accepted and the first order for next year's requirements has already been placed.

During the last year, contacts were made with a number of ringing stations overseas and an exchange of Ringing Reports was arranged with the following: The Australian Bird Banding Scheme, the Bird-Ringing Committee of the British Trust for Ornithology, the Swiss Ornithological Station in Sempach, the South African Ornithological Society, the Natural History Museum in Paris and the Ornithological Research Stations on Heligoland and Radolfzell in Germany. The interest shown in our scheme overseas is most gratifying and proves the value of the work done.

Following a report by Dr. Carrick, officer in charge of the Australian bird-banding scheme, an experiment was made on a small scale by one of our ringing operators, Mr. M. Fitzgerald, Gisborne, to ring birds with light reflecting plastic tape fixed on metal rings. As far as can be ascertained during the short time in use, this method is highly successful and will probably have a great future. North Island Wekas were used for this experiment, and the respective colours, or colour combination, were easily recognisable at night time by the use of a pocket torch for a distance of over 30 yards.

Some experience has now been gained on the new type B rings, reputedly manufactured from harder metal than the old rings used before 1956. It has again been noted that the wear, especially on larger sized rings (5, 6, 7 and 8) worn mainly by sea birds, has been very noticeable. A new approach will be made to the manufacturers in the U.S.A. in an attempt to rectify this matter.

RINGING OPERATIONS

During the period covered by this report one new ringing permit was issued, i.e. 37 members are now holding permits.

The number of individual birds ringed this year (5803) nearly equals the number of birds ringed last year (5853), but the number of species (46) has increased considerably, compared with 29 species last year.

The Ringing Committee regrets to advise that Mr. F. Abernethy is retiring this year, but hopes that, although living in a different environment, he will be able to continue in his ornithological studies. As can be seen from Table A below, Mr. Abernethy again this year heads the list of the number of species as well as the number of individual birds ringed.

The unusually large number of recoveries (852) and repeats (1394) made this year reflects the intensive studies being made at present on a number of species of birds.

The following Table A shows the results of the ringing operations conducted during the current year.

TABLE A

All species of birds ringed and recovered during the period covered by this report are shown in Table B below. Also included in the following Table B are the initials of the ringing operators concerned, and the places where the different birds have been ringed.

The following species have been ringed for the first time during this year: Black-browed Mollymawk, Grey-headed Mollymawk, Westland Black Petrel, Spotted Shag, North Island Weka, South Island Weka, Black-fronted Tern, Indian Myna.

The species in this Table and in the following Recovery report are listed in order in which they appear in the Society's "Checklist of New Zealand Birds" (1953) and similarly the vernacular names used are those used in the Checklist.

TABLE B

RECOVERIES

The signs and abbreviations used in the following list are those used by international agreement, as follows:

o = ringed

x = found dead or exhausted and eventually dead, the reason of death, if known, follows in brackets.

+ = shot or killed by man.

v = caught or trapped and released with ring.

() = caught and not released, or with ring removed.

= = found breeding or with juvenile(s).

s = sight record.

/?/ = manner of recovery unknown.

ad. = adult.

juv. = young or immature.

pull. = nestling or downy chick.

"M" = male.

"F" = female.

loco = recovered on or in close proximity to where ringed.

A date of recovery or repeat given in brackets indicates that the exact date is unknown so the date of reporting is listed.

A ring number, if in brackets, indicates that the bird was re-ringed and the number in brackets is the number of the original ring.

A ring number, if printed in "italics" indicates that the ring has been returned.

The distance in miles, if given, always indicates the approximate distance from "where ringed."

The "age," i.e. the length of time a bird was ringed, is given in a formula: years-months-days.

NORTHERN BLUE PENGUIN (*Eudyptula minor novaehollandiae*)

309 recoveries and 1,194 repeats were made of the birds ringed on Somes Island. All of these were made "loco" except the following seven recoveries, the most interesting of which is that of P-789:

P-730	o	ad. "M"	13/4/57	Somes Island 41°15'S-174°53'E
	x	(train)	16/10/57	Ngahauranga, Wellington Harbour, 3 m. W. 0-5-25

CAPE PIGEON (*Daption capensis*)

Cape Pigeons were very plentiful during last winter, and 149 recoveries show what good results can be obtained from regular trapping of birds at sea.

The most interesting recoveries are those of Nos. 38314 and 38826 approximately 800m from where ringed.

In addition to the recoveries listed below, two reports have been received of ringed birds having been seen from fishing vessels at sea, i.e. off Napier 39°28'S-176°55'E in July, 1957 and

off Oamaru 45°06'C-171°00'E in November and December, 1957.

The following recoveries are subdivided into three groups in accordance with where ringed.

A: off Cape Campbell 41°45'S-174°20'E

FLESHFOOTED SHEARWATER (*Puffinus carneipes hullianus*)

According to Mr. Abernethy's report, Flesh-footed Shearwaters were not as abundant in the ringing area (Kaikoura-Castlepoint) as during previous summers. Consequently fewer birds were ringed this year, and fewer recoveries were made, than could have been expected.

All recovered birds except one were ringed off Cape Campbell and therefore the ringing station is not repeated in every recovery.

AUSTRALIAN GANNET (*Sula bassana serrator*)

Two recoveries were reported this year from Cat Island, Bass Strait, where Dr. Serventy ringed 15 chicks and two adult birds with our rings in 1952.

The recoveries of gannets are listed below in three groups:

- A. ___ringed on Cape Kidnappers
- B. ___ringed on Horuhoru
- C. ___ringed at various other places.

As could be expected, more birds ringed as chicks are now being recovered on nesting sites as adults.

No. 36611 is the earliest juvenile gannet of any season recovered (21.2.58) from Australia.

This year recoveries can be summarised as follows:

Cape Kidnappers: 1 from Australia, 3 from N.Z. and 49 on nesting colony.

Horuhoru: 18 from Australia, 4 from N.Z. and 24 on nesting colony.

Various: 2 from Australia and 2 on nesting colony.

For further details see recoveries as listed below.

A: Ringed on Cape Kidnappers 39°38'S-177°05'E

NOTORNIS (*Notornis mantelli*)

Of the 30 Notornis ringed in Takahe Valley and Point Burn since 1952, eight were seen this year again where ringed.

SOUTHERN SKUA (*Stercorarius skua lonnbergi*)

One of the 40 Skuas ringed on Campbell Island was recovered only a short time after having been ringed. It was found inside a sea elephant carcass, partially eaten by other Skuas.

SOUTHERN BLACK-BACKED GULL (*Larus dominicanus*)

Of the 51 Black-backed Gulls recovered, 49 were ringed at Rangitoto Island (Auckland), one at Baring Head (near Wellington), and one in Palliser Bay, as follows:

Most of the Rangitoto Gulls were recovered in Auckland and environs and therefore in most cases only the place names are mentioned in the following, without indication of co-ordinates or distances.
